

Body Lice Infestation

What are body lice?

Body lice are parasitic insects that live on the body and in the clothing or bedding of infested humans. Infestation is common, found worldwide, and affects people of all races. Body lice infestations spread rapidly under crowded conditions where hygiene is poor and there is frequent contact among people. In the United States, body lice infestations are found only in homeless, transient populations who don't have access to changes of clothes or bath. Infestation is unlikely to persist on anyone who bathes regularly and regularly has access to freshly laundered clothing and bedding.

Where are body lice found?

Body lice are found on the body and on clothing or bedding used by infested people; lice lay eggs in the seams of clothing or on bedding. Occasionally eggs are attached to body hair.

Lice found on the hair and head are not body lice; they are head lice.

Can body lice transmit disease?

Yes. Epidemics of typhus and louse-borne relapsing fever have been caused by body lice. Though typhus is no longer widespread, epidemics still occur during times of war, civil unrest, natural disasters, in refugee camps, and prisons where people live crowded together in unsanitary conditions. Typhus still exists in places where climate, chronic poverty, and social customs prevent regular changes and laundering of clothing.

What are the signs and symptoms of body lice?

Itching and rash are common; both are your body's allergic reaction to the lice bite. Long-term body lice infestations may lead to thickening and discoloration of the skin, particularly around the waist, groin, and upper thighs. Scratching may cause sores on the body. These sores can sometimes become infected with bacteria or fungi.

How are body lice spread?

Body lice are spread through direct contact (touching) with a person who has body lice, or indirectly through shared clothing, beds, linens, or towels.

What do body lice look like?

There are three forms of body lice: the egg (sometimes called a nit), the nymph and the adult.

Nit: Nits are body lice eggs. They are generally easy to see in the seams of clothing, particularly around the waistline and under the armpits. They are about the size of the mark at the end of this arrow . Nits occasionally may also be attached to body hair. They are oval and usually yellow to white. Nits may take 30 days to hatch.

Nymph: The egg hatches into a baby louse called a nymph. It looks like an adult body louse, but is smaller. Nymphs mature into adults about 7 days after hatching. To live, the nymph must feed on blood.

Adult: The adult body louse is about the size of a sesame seed, has 6 legs, and is tan to grayish-white. Females lay eggs. To live, adult lice need to feed on blood. IF the louse falls off of a person, it dies within 10 days.

How is a body lice infestation diagnosed?

By looking closely in the seams of clothing and on the body for eggs and for crawling lice. If you are unsure about infestation, diagnosis should be made by a health care provider.

How are body lice infestations diagnosed?

Body lice infestations are diagnosed by looking closely in the seams of clothing and on the body for eggs and for crawling lice. If you are unsure about infestation, diagnosis should be made by a health care provider.

How are body lice infestations treated?

To treat infestations of body lice, the infested person should shower, change into clean clothes, and launder all infested clothing, bed linens and towels. When laundering items, use the hot water cycle (130°) of the washing machine. Set the dryer to the hot cycle to dry items.

A 1% permethrin or pyrethrin lice-killing shampoo, (also called a pediculicide, pronounced peh-DICK-you-luh-side), may be applied to the entire body of a person with extensive body hair. Pediculicide may be applied to hairy regions, such as legs and armpits, of people with localized body hair.

This fact sheet is for information only and is not meant to be used for self-diagnosis or as a substitute for consultation with a health care provider. If you have any questions about the disease described above or think that you may have a parasitic infection, consult a health care provider.
